

Paraffin Wax

Paraffin Wax

For many decades **Sasol Wax** has concentrated on the development of paraffin waxes and speciality waxes for many different industries. Due to the large variety of our products, we are able to offer solutions suitable for almost all production processes.

Micro- and macrocrystalline paraffin waxes are renown for a broad spectrum of applications. Their use ranges from relatively simple applications to process oriented tailor- made products for state of the art production equipment. Specialities are created for innovative solutions, e. g. as medium for latent heat storage.

Paraffin waxes are complex mixtures of many substances. They mainly consist of saturated hydrocarbons. These crude oil derivatives are purified and refined by modern, environmentally friendly technology (e. g. high pressure hydrogenation). **Sasolwax**[®] is free of harmful substances. All highly refined products are constantly monitored by a stringent quality control and are non- toxic. Their environmental properties are characterised by good biodegradability and non- cumulative effects.

We guarantee reliable and smooth processing of our products. In close co- operation with leading machine manufacturers, we fine- tune our paraffin waxes in order to meet the individual demand of manufacturing machines and production lines.

As a result of our considerable experience and our co- operation with specialist suppliers of other raw materials and machinery, we offer extensive guidance on application techniques, either at our company or at a venue of your choice.

Please contact us and we will be glad to assist you.
