

# Sasolwax 0970

## Paraffin Wax for the Production of Pressed Tealights

### The special properties of **Sasolwax 0970**:

- As well as fully hydrogenated paraffin wax this product contains vegetable triglyceride which is also of the highest purity and so acceptable for use in foodstuffs. The creamy white colour and minimal odour of *Sasolwax 0970* are typical of this product.
- *Sasolwax 0970* is especially suitable for the pressing of tealights. It fulfils the requirements of heat retention and the burning duration of tealights in accordance with RAL-GZ 041.
- The wick for the tealights should be adjusted to be slightly thicker than usual.
- Powder for pressing should be sprayed at circa 5 - 10 °C lower temperatures than usual.
- The addition of triglyceride means that the product cannot be stored as liquid for as long as pure paraffin wax. It is, therefore, recommended that using of the product is not delayed.
