

Sasolwax Flex

Sasolwax[®] Flex

Sasolwax[®] Flex is a novel Sasol Wax International AG development comprising **Sasobit[®]** plus Polymer plus a cross- linking agent.

In addition to the benefits of **Sasobit[®]** outlined above in improving high temperature stiffness (DSR), the Polymer contributes to elasticity at low temperatures in meeting the desired flexibility (BBR). The proprietary cross- linking agent (**Sasolwax[®] Link TX**) establishes a Polymer network system thereby working more effectively and providing opportunity for reduced Polymer loading in meeting target PG specifications. The Polymer selected may be SBS, SBR, Crumbed Rubber, Polyethylene, etc. This menu driven option provided by **Sasolwax[®] Flex** provides the Customer with freedom to select the best technical solution that will also be most cost effective. For example, the ratio of **Sasobit[®]** to any selected Polymer can be varied to suit a particular asphalt type and target specification.

New developments now make it possible for customers to have extruded pellet/ granular form of **Sasolwax[®] Flex** to meet individual customer preferences for transportation and handling.
