

Emulsions/ Dispersions

Emulsions/ Dispersions

A wax emulsion is a stabilized dispersion of solid paraffin wax particles in water.

A well- balanced combination of additives plus the use of a high pressure homogenizer in our production process enables us to obtain a particle size of under 10 μm .

Our wax emulsions offer, amongst other things, the following advantages:

- liquidity at room temperature
- simple processing
- useable for dry and water- based procedures
- good and even dispersion
- simultaneous metering with glue possible
